Before searching for information
figure out what you want to search for.

Create a list of **keywords** to use when
searching databases.

You won't find everything you need the
first time round, and you may need to
figure out different keywords

The forest in Ireland supplies wood to the
wardrobe factory...but the forest in the US supplies
timber to the closet factory!

Searching the **Databases:**

Campus Search(or Multisearch) is a good place to start

The screenshot shows the SE TU Campus Search interface. On the left is a sidebar with navigation links: 'My dashboard' (with a dropdown arrow), 'Projects', 'Saved', 'Recent activity', 'Holds & checkouts', 'Alerts', 'Research tools' (with a dropdown arrow), 'New search', 'Publication Finder', 'Concept map', 'Help', and 'Library Website'. The main area is titled 'Search articles, books, journals & more'. It features a 'Basic search' section with three search boxes. The first box contains 'endangered species', the second 'forests', and the third 'ireland'. Each box has a dropdown menu set to 'All fields' and a clear button (X). Below the search boxes is a '+ Add fields' button and a 'Search' button. Underneath, there are tabs for 'Filters', 'Search options', and 'Publications'. The 'Filters' tab is active, showing 'Limit your results (2)'. Two filters are checked: 'Full Text' and 'Available in Library Collection'. Two other filters, 'Peer Reviewed' and 'Catalog Only', are unchecked. A red arrow points from the text 'One keyword per box' to the 'endangered species' search box. Another red arrow points from the text 'Clicking full text will ensure you get access to the whole article and not just an abstract' to the 'Full Text' filter checkbox. A 'Clear all' link is located at the bottom right of the filters section.

Peer reviewed | Journal Article, Academic Journal

A spatial triage of at-risk conifer forests to support seed collection efforts and sustainable forestry.

By: Thorne, James H; Godfrey, Jessie M; Boynton, Ryan M; +5 more • In: Journal of environmental management, 2025 Jan • MEDLINE

At-risk conifer stands growing in hot, arid conditions at low elevations may contain the most climate change-adapted seeds needed for sustainable forestry. This study used a triage framework to identify high-priority survey areas for Pinus ponderosa (Pipo) ... [Show more](#)

 **Ecology and Silviculture of Oaks**
Johnson, P.S.; Shifley, S.R. and more
CABI 2001
ISBN: 9780851995700, 9780851998558
EDITION: 1
The current trend in managing forests and forested landscapes is away from a narrow focus on sustaining timber and other commodity outputs and toward a broader philosophy of sustaining desired ecosystems. This book is a source of ideas on how to think about oak forests as responsive ecosystems.
Available

 **A Critique of Silviculture : Managing for Complexity**
Puettmann, Klaus J.; Coates, K. David and more
Island Press 2008
ISBN: 9781597261463, 9781610911238
EDITION: 1

The connections between ecology and **silviculture** none the less are apparent and important, especially when **silviculture** is applied to forests of natural origin. In that setting, **silviculture** by itself may not introduce new species or populations (i.e. new genetic material) from outside the forest. Human energy expenditures are often limited only to those required in cutting and removing trees. Such relatively non-intensive practices have characterized the **silviculture** applied to oak forests of the United States. There, oak **silviculture** has largely followed an *ecological model* whereby forests are managed by directing their continually changing states, or ecological successions, through manipulation of existing on-site vegetation and propagules. This approach relies on periodic timber harvesting and usually natural regeneration to maintain or periodically re-

accepted because of its purely utilitarian value, and its physical origins borne of human endeavour. Socially, **silviculture** is a more complicated issue. It is vulnerable in appearance, conceptually and often physically, seen as conforming to neither preservation nor agronomy. It is neither fish nor fowl, yet is often identified as disruptive if not exploitative of nature.

To the non-silviculturist, application of the ecological model to **silviculture** may sometimes be difficult to distinguish from purely exploitative and environmentally damaging practices. However, such exploitation is not the intent of, nor does it constitute, **silviculture**. **Silviculture** is not synonymous with timber harvesting, yet is dependent upon it. The objective of modern **silviculture** is to create and maintain forests by design that produce material and non-
